

The List of Rule Revisions

Version No.	Date	Remarks
V1	2016-06-24	None

The content presented below serves as the primary rules of this competition. However, if there are cases not stipulated or clearly defined in the rules, the organizer reserves the right of final interpretation of the cases.

<u>1. The overview of this competition</u>

Each team is required to design and construct a building model at the competition venue. The model should be able to resist the earthquakes generated by the shaking table at National Center for Research on Earthquake Engineering (NCREE).

This is a two-day competition. On the first day, each team has 6.5 hours (including a lunch break) for constructing the building model. All the materials and tools are provided by the organizer.

On the second day, all models will be tested on the shaking table at NCREE. The artificial earthquakes with various intensities will be generated by using the shaking table. The peak ground acceleration (PGA) will gradually increase to 800 gal (gal = cm/sec^2).

All models are ranked by using the efficiency ratio (ER). The value of ER is computed based on the mass of the model itself, the number of mass blocks supported by the model and the PGA eventually resisted by the model. The winner will be the team whose model obtains the largest value of ER.

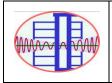

In order to increase the challenge and interest of this competition, the theme of this year's competition is "Elevated First Floor". All teams are encouraged to exert their knowledge and creativity to construct effective and efficient building models.

2. The composition of team members

Each team consists of four students registered in the same university/college and one instructor, who is a teacher at the same school. During the two-day competition, the instructor is not allowed to use hands on constructing the model.

3. Materials and tools

Only the materials and the tools provided by the organizer can be used in this competition. Stationeries, e.g. pencils, rulers, erasers, and calculators, can be prepared by the teams. Nevertheless, these stationeries can be used only for computing and marking the materials. They cannot be used for cutting and drilling.

3.1 Materials

The materials provided by the organizer include:

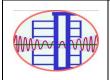

Item	Quantity	Details
1. Wooden base		It is made of medium density fiberboard (MDF). The size
board	1	of the board is about 0.55 cm thick, 26 cm (L) \times 26 cm (W)
		(±0.3 cm).
2. Wooden stick		They are made of MDF. They are used for constructing the
	40	model. Each stick is 70 ± 0.5 cm long with a 5.5 mm \times 4
		mm (±1 mm) rectangular cross section.
3. Hot-melt glue		Each stick is about 30 cm long and 6 mm in diameter.
stick	20	These glue sticks cannot be used as the members of the
		building model.
4. Rubber band	16	Each rubber band is 3 mm wide, 1.5 mm thick, and the
	10	perimeter is about 240 mm.
5. A4-size paper	12	12 sheets of A4-size paper
6. String	1	A tinted cotton string with 4 m long
7. Bamboo stick	1	This item is used for making the team flag.

3.2 Tools

The tools provided by the organizer include:

Item	Quantity	Details
1. Check frame	1	This tool is used for checking the building area.
2. Scissors	1	It is a general office scissors.
3. Wire saw	1	0.9 cm wide and 30 cm long
4. Tape measure	1	The total length is 5.5 m.
5. Manual drill	1	Its bit is 8 mm.
6. Hot-melt glue gun	1	It is a general hot-melt glue gun
7. Large utility knife	2	The width of the blade is about 1.8 cm.
8. Pencil	1	It is a general office pencil.
9. Pencil sharpener	1	It is for sharpening the pencils.
10. Protractor	1	It is a general office plastic semicircular protractor.
11.Marker pen	1	It is a general office marker pen.
12.Ruler	1	30cm long plastic straight ruler
13. Cotton gloves	2	The participators can wear the cotton gloves to avoid
		burns when using the hot-melt glue gun.

Before constructing the model, each team should make sure that they have received all the materials and tools list above. If any material/tool is missed or damaged, please report to the judges for assistance.

2016 IDEERS Rules

for High School Teams

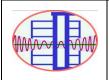

The tools provided by the organizer

4. The features of the model

All teams are encouraged to exert their creativity on constructing the model. Nevertheless, the following rules related to the models need to be complied with.

Item	Details
4.1 Basic structure	4.1.1 All models must follow the common rules of building construction. That is to say, the models are composed of the basic structural components of building structures, e.g., beams, columns, slabs, walls, and bracings.
	4.1.2 The structural components should be composed of the materials provided by the organizer. For example, the structural components can be composed of a single wooden stick, multiple wooden sticks, strings, rubber bands and papers.
	4.1.3 It is not necessary to add claddings/decorations to the models for the purpose of aesthetic appearance. Even if claddings/decorations are added into the model, the clearance requirements stated in section 4.7 should be still met. It should be feasible for the judges to inspect and compute the building area of the model.

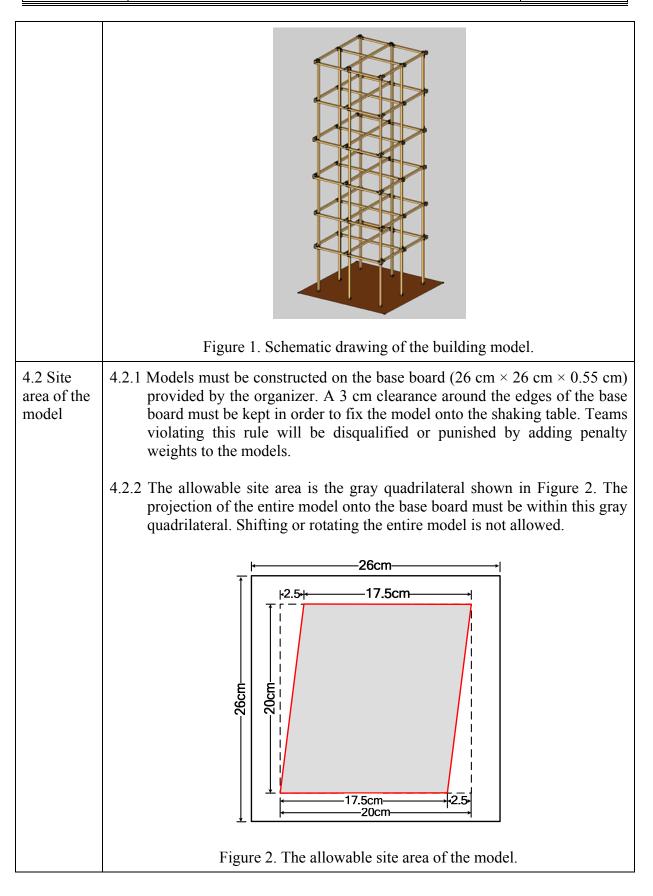

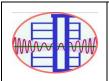

2016 IDEERS Rules

IDEERS2016-V1

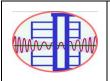

for High School Teams

2016-06-24 5 of 21

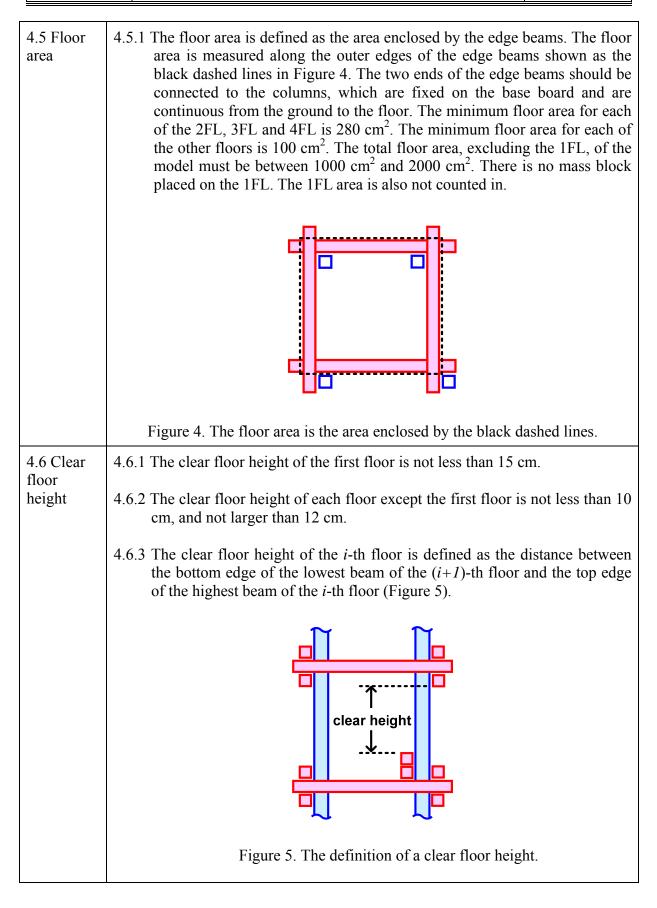

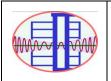

4.3 Number of	4.3.1 It is allowed to drill holes on the base board for fixing <i>columns</i> . There is no restriction on the number of columns fixed on the base board.		
wooden sticks fixed on the base board	4.3.2 It is acceptable to carry out enhanced measures (e.g., enlarged holes, cotton strings running in a ditch, etc.) to fix columns on the base board. Nevertheless, the enlarged holes, ditches, etc. arising from the enhanced measures should be backfilled with hot-melt glue to avoid intended reduction of the base board weight.		
	4.3.3 The base board should be kept flat and integral so that it can be mounted onto the shaking table without troubles.		
	4.3.4 All of the columns must be fixed on the base board. Isolated systems are not allowed.		
4.4 Floors	4.4.1 Figure 3 shows the minimum area of each floor. There are at least four complete floors in the model (Figure 3). That is to say, except the 1FL, there are at least four floors can be loaded with mass blocks.		
	4.4.2 The total height of the model, measured from the top of the base board to the top of the RFL, must be not less than 45 cm and not larger than 70 cm.		
	4.4.3 All floors, including the RFL but excluding the 1FL, will be loaded with mass blocks. The weight factor for the mass blocks on every floor, which will be used to compute the ER, is shown in Figure 3.		
	RFL

for High School Teams

2016 IDEERS Rules

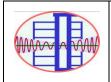

5. The placement of mass blocks

In reality, buildings are subjected to various types of loading. In this competition, mass blocks are used to simulate the vertical loading occurred in real buildings. The rules of placing the mass blocks are:

5.1 The material of the mass blocks is steel. The dimension of each mass block is $6.0 \text{ cm} \times 4.5 \text{ cm} \times 3.0 \text{ cm} (\pm 2 \text{ mm})$. The weight of each mass block is about 635 g. The average vertical loading on each unit floor area is 10 g/cm². The required number of mass blocks on each floor is computed using Equation (2). Then the computed number should be rounded off to the integer place.

Number of mass blocks = floor area
$$(cm^2) \times 10 / 635$$
 (2)

- 5.2 All models should be loaded with at least the number of mass blocks computed from Rule 5.1. One team may choose to install additional two mass blocks on each floor at most. The total number of mass blocks must be not larger than 40. All of the mass blocks must be in compliance with Rules 5.3 to 5.6. Otherwise, the penalty weight is imposed on the model (Table 1). The number of mass blocks of each floor cannot be changed after the referee's approval in the model inspection.
- 5.3 Mass blocks may be placed horizontally or vertically on the floors. Nevertheless, mass blocks cannot not be stacked up.
- 5.4 Mass blocks can be placed on top of beams, but cannot touch columns or bracings. Mass blocks cannot extrudes beyond the boundary of a floor ≥ 5 mm. The mass blocks, which touch columns or bracings, are treated as a part of the structure. In addition, the clear floor height will be computed starting from the highest contact point instead of the top edge of the highest beam.
- 5.5 Mass blocks are placed on the floor when mounting the model to the shaking table. Only hot-melt glue can be used to fix mass blocks to the floors. Other materials, such as paper, cotton string, rubber bands etc., are not permitted to fix mass blocks.
- 5.6 If any individual mass block installed onto the model floors is found to have one or more of the following conditions, that particular mass block will incur 50 grams of penalty weight, and that mass block will not be counted into the calculation of Efficiency Ratio:
 - 5.6.1 A mass block extrudes beyond the boundary of a floor \geq 5 mm.
 - 5.6.2 A mass block touches columns, or bracings.
 - 5.6.3 Mass blocks are stacked up vertically.
 - 5.6.4 The actual number of installed mass blocks does not conform to the approved number shown in the Calculation Sheet (caused by either mistakes or uncompleted installation).

Example:

Floor no.	Floor area (cm ²) (A)	Calculated mass blocks (B)=(A) × 10 / 635	Required mass blocks (C)	Actual applied mass blocks (D)	Weighting (E)
RFL	100	1.57	2	4	3
6FL	150	2.36	2	4	2
5FL	250	3.94	4	6	2
4FL	280	4.41	4	6	1
3FL	320	5.04	5	7	1
2FL	350	5.51	6	8	1

<u>6. The grading rules</u>

The criterion used for grading the performance of the models is the efficiency ratio (ER). The ER is computed as:

$$ER(EfficiencyRatio) = \frac{I \times \sum W_i}{M_M - M_B + M_P}$$
(3)

where:

I: The maximum seismic intensity resisted by the model (gal).

 $\sum W_i$: The total weighted number of mass blocks supported by the model. The number of

mass blocks on different floors is multiplied by different weight factors (Figure 3). The weight factor for the mass blocks on the 2FL, 3FL, and 4FL is equal to one. The weight factor for the mass blocks on the 5FL and 6FL is two. The weight factor for the mass blocks on the 7FL and upper floors is three. It is noted that there is no mass block placed on the 1FL.

- M_M : The mass of the model itself (including the base board, but excluding the mass blocks).
- M_B : The mass of the base board.
- M_P : The penalty mass, which penalizes the violation of the competition rules. The detail of the penalty mass is shown in Table 1.

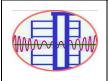

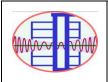

Table 1.	The computation	rules for pe	enalty mass.
----------	-----------------	--------------	--------------

Rule No.	Violations	Penalty mass
15.3	Clean up the working area and arrange the tools in order	500g
4.2.1 4.2.2	The site area of the model and the clearance along the edge of the base board (\geq 3 cm)	500g
4.4.1	Except the 1FL, there are at least four floors can be loaded with mass blocks.	500g
4.4.2	The total height of the model (45 cm \le H \le 70 cm)	200g
4.5.1	Except the 1FL,the total floor area (1000 cm ² \leq A \leq 2000 cm ²)	100g
4.8.6	The interior clearances for the 1FL	500g
5.1 5.6	Violation of mass block installation requirements	50 g / block
4.6.1 4.6.2	The clear floor height $(1FL \ge 15cm; 10cm \le all \text{ other floors} \le 12cm)$	50g / cm
4.7.6 4.7.7	Exterior clearance $\Sigma Xi / \Sigma Li$ (1FL>70%, OTHER FLRS > 45%)	10g / %
4.8.4	Interior clearance (must \geq 5 cm for all floors)	100g / cm
4.5.1	Floor area (2-4FL: > 280 cm ² ; 5FL-RFL > 100 cm ²)	$5g/cm^2$

Example:

There is a model with the mass of the model itself, M_M , equal to 750 g, and the mass of the base board, M_B , equal to 275 g. In addition, the penalty mass, M_P , is 50 g because the clear height of one floor is only 9.6 cm. There are 7, 7, 7, 7, 6, and 6 mass blocks placed on the 2FL, 3FL, 4FL, 5FL, 6FL and the RFL, respectively. This model passes the shaking test with a PGA equal to 700 gal (i.e., I = 700), but fails at the subsequent shaking test with a PGA equal to 800 gal. The efficiency ratio of this model is computed as:

$$ER = \frac{I \times \sum W_i}{M_M - M_B + M_p} = \frac{700 \times (7 \times 1 + 7 \times 1 + 7 \times 1 + 7 \times 2 + 6 \times 2 + 6 \times 3)}{750 - 275 + 50} = 86.67$$

7. Mounting models onto the shaking table

Before the models are tested on the shaking table, there are periods allowing all teams to mount their models onto the shaking table and fix mass blocks on the floors of models.

- 7.1 Only two members of each team are allowed to mount their model onto the shaking table and fix the mass blocks. This task should be completed within 15 minutes. The team members are responsible for the completion of this task.
- 7.2 The organizer will provide a screwdriver and screws to each team for mounting the model onto the shaking table.
- 7.3 The organizer will provide a hot-melt glue gun and hot-melt glue to each team for fixing the mass blocks on the floors of the model.
- 7.4 The materials and tools not provided by the organizer cannot be used to mount the models onto the shaking table and fix the mass blocks.
- 7.5 During the period of mounting the models onto the shaking table and fixing the mass blocks, it is not allowed to strengthen the structure of the model.
- 7.6 The team members mounting the models onto the shaking table should be careful not to touch other teams' models, which have already been mounted on the table.
- 7.7 After all teams completed the task of mounting their models onto the shaking table and fixing the mass blocks, the staffs of this contest will check whether or not all models are safely mounted on the shaking table and make necessary reinforcement. Nevertheless, each team is still completely responsible for the fixture of the model and the mass blocks.
- 7.8 The judges will examine all models mounted on the shaking table. The model with the following conditions stated in 7.8.1 to 7.8.3 will be required to make modifications of the model within an allowed time period. Otherwise, a certain penalty will be given to the model by the judges. Sometimes, in the worst case, the team may be disqualified for ranking in this contest.
 - 7.8.1 The number of mass blocks on each floor is not consistent with that reported in the check table.
 - 7.8.2 Mass blocks are attached to columns/bracings by using hot-melt glue.
 - 7.8.3 Mass blocks are beyond the boundary of the supporting floor ≥ 5 mm.
- 7.9 The side of the base board marked with a sticker is where the model should be built on. In addition, when mounting the model onto the shaking table, the sticker should be on the northwest corner (shown as Figure 13). If there is any question about the relative positions or directions shown in Figure 13, please ask the staffs/judges for assistance.

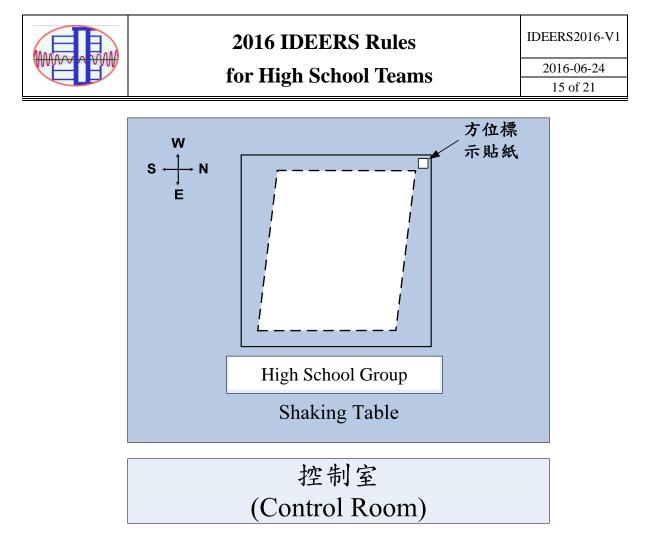

Figure 13. The orientation of the model fixed on the shaking table.

7.10 The base board is fixed to the shaking table by using a metal plate (Figure 14). Please note the orientation of the metal plate because the layouts of the holes on the four sides of the metal plate are not the same.

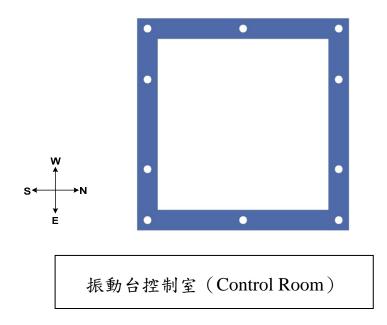

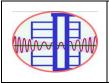

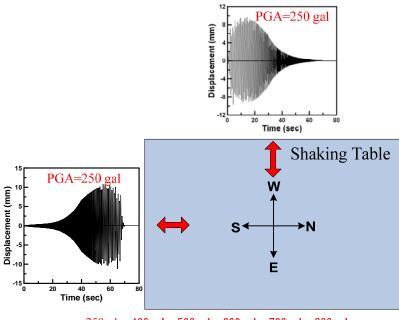

Figure 14. The metal plate for fixing the base board

8. Loading protocols

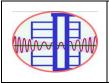

All models will be tested simultaneously on the shaking table. The artificial earthquakes generated by the shaking table contain a broadband of sweeping excitation frequencies. The intensity of each artificial earthquake is represented by using the peak ground acceleration (PGA). The PGA increases from one test to another. Figure 15 shows the two components of the displacement time histories of the artificial earthquake with the PGA equal to 250 gal.

- 8.1 There will be at most six tests, in which the PGAs are arranged in the sequence of 250 gal, 400 gal, 500 gal, 600 gal, 700 gal, and 800 gal.
- 8.2 The teams whose models pass the test with the PGA equal to 400 gal, which is equivalent to an earthquake with the intensity VI in Taiwan, will receive the Quake-Resistant Certificate.
- 8.3 Only the models passing the test with the PGA equal to 600 gal are qualified for ranking in this contest.
- 8.4 The bidirectional time histories of the artificial earthquakes are available on the IDEER's website. All teams are encouraged to download these data.
- 8.5 The mentioned directions are according to those specified in the lab. Figure 13 shows the directions and the orientation for mounting the models to the shaking table.

 $250 gal {\rightarrow} 400 gal {\rightarrow} 500 gal {\rightarrow} 600 gal {\rightarrow} 700 gal {\rightarrow} 800 gal$

Figure 15. The E-W and N-S components of displacement time histories of the artificial earthquake with the PGA equal to 250 gal.

9. The failure criteria

A model will be judged to fail the test when the following conditions occur:

- 9.1 Any floor is unstable or collapsed.
- 9.2 Any mass block falls off, significantly dislocates, sways, or rocks.
- 9.3 The number of columns detached from the base board is larger than or equal to one half of the total number of columns.
- 9.4 The residual displacement of the inclined model, which is the horizontal distance measured from the original roof position to the final roof position, is greater than or equal to 10 cm.
- 9.5 The jury has the consensus that a model fails in the test.

10. The check frame

A check frame shown as Figure 16 is provided to each team by the organizer. In order to make sure that the models are built within the allowable area, all teams are suggested to utilize the check frame by putting this frame through the models. Every horizontal cross section of the model should be within the opening of the check frame. The model violating this rule will be punished by adding 500 g penalty mass.

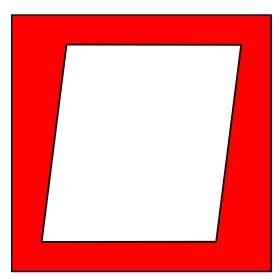

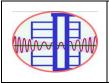

Figure 16. The shape of the check frame.

<u>11. The exhibition object</u>

Each team must prepare an exhibition object displaying the design concept and creativity of the model. This exhibition object is done before this two-day competition. The object could be either two-dimensional or three-dimensional. The way of exhibition could be in a static and/or dynamic style. The space for this exhibition is limited to 35 cm (height) \times 25 cm (width) \times 25 cm (depth) shown as Figure 17. The Design-Concept Exhibition Award is granted based on the clarity and creativity of displaying the design concept of the model. The affiliation of the team including the department and the university/college should be presented in the exhibition object. If the exhibition object uses electronic products, the team is responsible for the safe keeping of the electronic products. In addition, the team is responsible for the power supply to the electronic products.

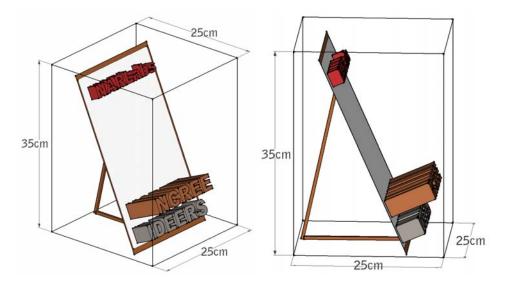

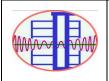

Figure 17. The allowable exhibition space

<u>12. The team flag</u>

Each team must design a team flag, which is installed on the model during the first day of this contest. This flag may be drawn before or during this contest. All possible shapes of this flag are allowed. Nevertheless, the size of this flag should be no larger than that of a sheet of A6-size paper (14.4 cm L \times 10.5 cm W, i.e., a quarter of an A4-size paper). This flag can be installed on the model by using any provided materials, such as the bamboo sticks.

13. Model inspection

The period of the model inspection begins at the end of the model construction and ends at the start of the shaking table tests.

13.1 The procedures of the model inspection are:

(1) The host calls the team number. (2) The team members weigh the model. (3) The judges inspect the model and then fill in the inspection form. (4) The staffs take a picture of the model and the exhibition object. (5) The team members place the model and the exhibition object on the designated table for displaying. On the second day, all competitors and judges vote models and exhibition objects for some special prizes. (6) Two team members mount the model onto the shaking table for the tests.

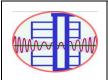

- 13.2 The items submitted to the judges for inspection are:
 - (1) the model, (2) the model inspection form, (3) the calculation sheet of the floor area,
 - (4) the check frame and (5) the exhibition object.
 - All of the abovementioned items are taken to the judges by two members of each team.
- 13.3 During the model inspection period, judges have the right to request the model to be modified or to make penalties to the model if the model violates the contest rules. During the two-day contest, jury has the right to re-inspect any models. The team, whose model needs to be re-inspected by the jury, cannot reject this request.

<u>14. Architectural Aesthetic Awards, Structural Design Awards, and</u> Design-Concept Exhibition Awards

14.1 Aesthetic Architecture Awards are granted on the basis of the architectural features, the efficiency of using the site area, and the plan of inner space. The jury chooses at most three models for these awards. The team winning this award will be granted NT\$5000 and a certificate for each team member. The evaluated items and the corresponding weights for these awards are:

item	weight	contents
architectural features	70%	Aesthetic of architectureArchitectural feature and creativity
the efficiency of using the site area and the plan of inner space		The rationality and comfort of inner spaceThe rationality of using the site area

14.2 Structural Design Awards are granted on the basis of the structural design of models, the concept and creativity of seismic resistance. The jury chooses at most three models for these awards. The team winning this award will be granted NT\$5000 and a certificate for each team member. The evaluated items and the corresponding weights for these awards are:

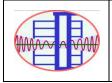

item	weight	contents	
Structural design	70%	The arrangement of structural membersThe rationality of loading path	
the concept and creativity of seismic resistance	30%	 The rationality of the concept of seismic resistance The creativity of the concept of seismic resistance 	

14.3 Design-Concept Exhibition Awards are granted on the basis of the clarity and creativity of displaying the design concepts of the models. The jury chooses at most three models for these awards. The team winning this award will be granted NT\$3000 and a certificate for each team member. The evaluated items and the corresponding weights for these awards are:

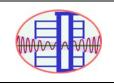

item	weight	contents	
Introduction of the design concept	60%	The clarity of introducing the design concept	
The way of showing the design concept	40%	 The vividness of the way showing the design concept The creativity of the way showing the design concept 	

15. Special notices

- 15.1 In comparison with the contest rules adopted in previous years, there are significant modifications in this year's contest rules. All participants should read all contest rules in detail. The main modifications of the contest rules in this year are:
 - 15.1.1 The modification of the site area.
 - 15.1.2 The modification of the minimum number of floors.
 - 15.1.3 The modification of the clear height of every floor.
 - 15.1.4 The modification of the every floor area and the total floor area.
 - 15.1.5 The exterior clearance of the 1FL must be larger than 70%.
 - 15.1.6 The number of mass blocks for each floor is computed according to the floor area. The computed number is then rounded off to the integer place. One team may choose to install additional two mass blocks on each floor at most. The total number of mass blocks must be not larger than 40.

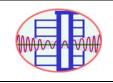

- 15.2 In order to save the inspection time, each team should complete the model inspection form, the calculation sheets of the floor area and the number of mass blocks before submitting the model to the judges for inspection.
- 15.3 Each team must clean their working area and arrange the tools in order after completing their model. Otherwise, the team will be punished by adding a penalty weight equal to 500 g.
